Direct patient to provide first-catch urine (20-50mL) into a urine collection cup.
Note: The patient should not have urinated for at least 1 hour prior. Patient should not cleanse the genital area prior to collecting specimen.

The Xpert® CT/NG Urine Specimen Collection kit contains:
- Large transfer pipette
- CT/NG Urine Transport Reagent tube

Open the package of disposable transfer pipette provided in the kit.

Remove the yellow cap from the transport tube.

Transfer approximately 7mL of urine into the transport tube, using the disposable transfer pipette. The correct volume is marked by the black dashed line on the label.

Replace the yellow cap on the transport tube and tighten securely.

Invert the transport tube 3-4 times to ensure that the specimen and reagent are well mixed.

Return the tube as instructed by your doctor, nurse or care-provider.
Note: Health care provider should label the transport tube with the sample identification information, including date of the collection, as required.
